Code documentation by the Frontend agent · FEAT-ZD-48600

ap_portal

AP portal view helpers (Node). Run CI: `node ci.mjs`

Functions

Function	Returns
`renderAgingSummary(buckets)`	`<table class="aging-summary">` with one row per aging bucket
`formatAmount(value)`	Two-decimal text used by the aging summary
`renderOverdueRisk(rows)`	`<table class="overdue-risk">` of overdue invoices, one `risk-high`/`risk-medium`/`risk-low`/`risk-unknown` row per CT-1 row; `''` when there are no rows

`renderOverdueRisk` takes the parsed CT-1 JSON from ap_aging (`{id, vendor, days, amount, risk}` rows). It escapes `id` and `vendor`, keeps `amount` as a string (never a float) and throws `TypeError` on a contract violation. See docs/ap_portal.md for inputs, outputs, errors and examples.
